

# Vacuum System Survey Measures Performance of Vacuum Pumps

Are you sure you have enough airflow from your vacuum service (pumps) to adequately dewater your wire and press sections? Have you recently increased your machine speed or have plans to speed up? How worn are your pumps in terms of supplying original airflow? A 1 percent improvement in sheet dryness into the dryer section is worth millions per year in increased production, reduced dryer steam, improved runnability and sheet quality.

We can measure your pumps actual airflow during an outage and supply a complete survey of your vacuum elements, suction rolls, suction boxes, vacuum foils, inlet separators, etc. We supply a complete written report with recommendations.
